

TreeSteamer-Batch©

by

for citrus greening and other citrus diseases

With citrus diseases devastating citrus groves around the world and research for decades and hundreds of millions spent, Scientists from the University of Florida and USDA found **the magic bullet: Heat Treatment.**

TreeSteamer-Batch©, unit works best in **reset groves with various size trees.** By using the TreeSteamer-Batch©, it gives growers more options such as treating a single tree on one side of the machine and three trees on the other side of the machine without moving.

The Batch unit can handle **3-4 sizes of octagon treatment containers** for different size target trees. The specialized unit is built from the workings of the **diesel citrus harvest goat with a long boom.**

It still carries all of the water needed, fuel, a corkscrew boiler with a pump and surge accumulator tank along with a generator to run the boiler and octagon tree heat containers. It will have safety thermal controls and camera system with a bigger rotation radius boom to be efficient.

It's just another way of treating many different sizes of trees for greening and other citrus problems in a grove and being labor efficient.

ScoringAg invented **mobile steam equipment, the TreeSteamer© and TreeSteamer-Batch©, units with heat treatment** that suppresses the **greening disease**, and others like **citrus canker, black spot, plant lice, spider mites, leaf miner and more.** Whatsoever bothers your trees most and makes them die, steam heat will stop the process and make the tree healthier.

Put a TreeSteamer© in your grove today from ScoringAg and stop greening, canker and others in its tracks.
